School of Engineering and Computer Science Victoria University of Wellington

This Lecture

- · Various topics about arrays and pointers
 - Pointer arithmetic
 - Arrays of pointers
 - Pointers to arrays
 - Pointers to pointers
 - Multi-dimensional arrays and pointers

Pointer Arithmetic

- If ptri is a pointer to int i, then (ptri+1) is the address for storing/accessing the next int
 - We can do: ptri += n, ptri++, --ptri, etc.

Pointer Arithmetic

An example (reverse printing)

```
#define SIZE 10
  int main(void)
    for (i=0; i<SIZE; i++)
      x[i] = i;
                        /* call for reverse printing */
    rprint(x);
     return 0;
                              /* void rprint(int a[])
  void rprint(int *a)
   { int *p=a+SIZE-1;
                              /* p=&a[9] */
    for (p; p>=a; p--)
                              /* decrement p */
      printf(x[%d]=%d, &x[%d]=%x\n", \
         (p-a), *p, (p-a), p);

Pointer Arithmetic

• As mentioned earlier, an array name is a pointer

```
int i[10];
/* i is a pointer to int */
/* void rprint(int a[]) */
/* void rprint(int *a) */
```

• And, we can do pointer arithmetic

```
int *p = i; p++; --p;
```

• Can we do

```
i++; --i;
```

Pointer Arithmetic

• As mentioned earlier, an array name is a pointer

```
int i[10];
/* i is a pointer to int */
/* void rprint(int a[]) */
/* void rprint(int *a) */
```

• And, we can do pointer arithmetic

```
int *p = i; p++; --p;
```

· Can we do

```
i++; --i; /* i is a pointer value */
```

Arrays of Pointers

- Arrays of pointers
 - The elements in an array are pointers

Arrays of Pointers

- Arrays of pointers
 - The elements in an array are pointers

- i[0] is an int pointer
- *i[0] is the integer that i[0] points to

What's this?

```
int (*i)[10];    /* similar to *i[10]? */
```

Multi-dimensional Arrays and Pointers

• One-dimensional arrays

```
int i[2] = \{2, 1\};
```

 A one-dimensional array of one-dimensional arrays is a two-dimensional array

```
int i[2][3] = \{\{4,1,2\}, \{9,8,5\}\};
```

 A one-dimensional array of two-dimensional arrays is a three-dimensional array

```
int i[3][2][4] = \{\{\{5,4,2,3\}, \{9,5,1,7\}\}, \{\{3,7,5,4\}, \{6,7,6,8\}\}, \{\{5,4,7,1\}, \{5,5,4,0\}\}\}
```

Multi-dimensional Arrays and Pointers

Use arrays of pointers to express two-dimensional arrays

```
char *a_week[7] = { "Mon", "Tue", ...};
- the row length depends on the actual needs (e.g., 4
  bytes for Mon\0)
sizeof(week); /* 7*10 = 70 */
```

- the row length is fixed 10 bytes
